Climate

Equinor's ambition is to be a leading company in the energy transition and to become a net-zero company by 2050. This section contains data related to GHG emissions from operations, products and supply chain, as well as renewables and low carbon solutions.

GREENHOUSE GAS (GHG) EMISSIONS

Indicator	Boundary	Unit	2025	2024	2023	2022	2021	2020	2019	2018	2017
Scope 1 GHG emissions [1]	Operational control	million tonnes CO2e	10.04	10.9	11.48	11.37	12.01	13.29	14.72	14.95	15.39
Scope 1 and 2 GHG emissions Norway [2]	Operational control	million tonnes CO2e	9.16	10.24	10.87	10.98	11.1	11.91	12.39	13.01	13.43

[1]: As a result of recent nationalization of certain oil and gas infrastructure in Norway, Equinor no longer retains ownership in certain assets where we serve as the Technical Service Provider (TSP), including the Kollsnes, Kårstø, and Draupner (KKD), the KKD assets are not included in the operational control boundaries from 2025, and this impacts the difference in figures between 2024 and 2025.

[2]: Scope 2 emissions are location-based.

EQUINOR'S GHG INTENSITY FOR NORWEGIAN GAS (SCOPE 1 AND 2)

Indicator	Boundary	Unit	2025	2024	2023	2022	2021	2020
Upstream GHG intensity of piped gas	Operational control	g CO2e/MJ	0.9	0.9	1	1.1	1.1	1.2
Upstream methane intensity of piped gas	Operational control	%	0.005	0.004	0.005	0.006	0.005	0.004
Upstream GHG intensity of LNG	Operational control	g CO2e/MJ	4.1	3.3	3.8	4.1	N/A	4.3
Upstream methane intensity of LNG	Operational control	%	0.01	0.01	0.01	0.01	N/A	0.01

MARITIME CO2 EMISSIONS

Indicator	Boundary	Unit	2025	2024	2023	2022	2021	2020
Maritime CO2 emissions [3]	Operational control	million tonnes CO2e	4.01	4.2	4.14	3.83	3.82	4.86

[3]: All vessels contracted by Equinor. The boundary is aligned with Equinor's maritime ambition, which also includes Scope 1 emissions from drilling rigs

PORTFOLIO STRESS-TEST [9]

Indicator	Boundary	Unit	2025	2024	2023	2022	2021	2020	2019	2018	2017
NPV effect of International Energy Association (IEA) Stated Policies Scenario (STEPS)	Equinor group	%	-1	2	11	41	30	21	18	13	20
NPV effect of IEA Announced Pledges (APS) [10]	Equinor group	%	N/A	-12	-5	17	12	N/A	N/A	N/A	N/A
NPV effect of IEA Current Policies	Equinor group	%	10	N/A	N/A	N/A	N/A	0	36	28	42
NPV effect of IEA Net Zero Scenario (NZE) [11]	Equinor group	%	-28	-34	-42	-22	-34	-23	-17	N/A	N/A
Minimum internal carbon price [12]	Equinor group	USD	100	92	82	68	58	56	55	55	50

[9]: The stress test is conducted by replacing Equinor's oil, gas and carbon price assumptions with the price assumptions in the International Energy Association (IEA) Scenarios in the annual World Economic Outlook report. The impact on Equinor's net present value (NPV) is provided and shown relative to the NPV using Equinor's planning assumptions.

[10]: APS excluded from the 2025 edition of IEA's world energy outlook (WEO).

[11]: The Net Zero Scenario is consistent with limiting temperature rises to 1.5° C with 50% probability.

[12]: Starts at 100.4 USD in 2027 and increases to 121.8 USD per tonne (real 2025) by 2030 and stays flat thereafter. In countries where a higher price applies or is expected, Equinor uses the actual and expected price. See "Carbon taxes and quotas" below.

ENERGY PRODUCTION (FOSSIL FUEL EQUIVALENTS)

Indicator	Boundary	Unit	2025	2024	2023	2022	2021
Oil production	Equity basis	TJ	2,237,435	2,257,347	2,313,473	2,107,484	2,239,149
Gas production	Equity basis	TJ	2,208,606	2,054,543	2,018,514	2,135,223	2,086,735
Gas to power [14]	Equity basis	TJ	13,737	13,145	15,514	6,783	0
Wind energy delivered to grid [15]	Equity basis	TJ	26,478	22,315	15,153	13,330	13,318
Solar energy delivered to grid [15]	Equity basis	TJ	7,805	5,094	3,028	2,720	1,966
Total energy delivered to the market [14, 15, 16]	Equity basis	TJ	4,494,060	4,352,442	4,365,682	4,265,540	4,341,168
Share of energy production from renewables [14, 15, 16]	Equity basis	%	0.8	0.6	0.4	0.4	0.4

[14]: The primary energy of fossil based electricity is equal to the energy content of the combusted fuel. Actual gas consumption data is used to calculate this figure.

[15]: The primary energy of renewable electricity is calculated based on the equivalent amount of fossil fuel required to generate that amount of electricity in a standard thermal power plant with an efficiency of 36,8%. This means that renewable energy delivered to grid (expressed as TJ) is multiplied with a factor 1/0,368 = 2,7.

[16]: [1] Energy delivered to grid from gas fired power plants based on third party gas.

Definitions

- **Capex**: Capital expenditure
- **Carbon dioxide (CO_2) emissions**: CO_2 released to the atmosphere as a result of our processes and activities, including CO_2 emissions from energy generation, heat production, flaring (including well testing/well work-over), and remaining emissions from carbon capture and treatment plants. Separate data compiled for Equinor operated activities and equity basis.
- **CO_2 emission reductions**: Emission reductions achieved by implementing a specific measure compared to the expected emissions at an installation without the measure.
- **Energy consumption**: Energy consumption includes energy consumed in producing the facility's deliveries or by performing an activity, that is the sum of imported energy, energy generated by own activity and unused energy minus delivered/sold energy.
- **Flared hydrocarbons**: Weight of hydrocarbons combusted in operational flare systems. Includes safety and production flaring.
- **Flaring intensity**: Flared hydrocarbons from upstream activities (excluding LNG) per thousand tonnes of hydrocarbons produced.
- **Greenhouse gases (GHG)**: For Equinor, the relevant GHGs are CO_2, CH_4 and N_2O. Other GHGs are not included as they are assessed to be non-material for Equinor.
- **Methane (CH_4) emissions**: CH_4 released to the atmosphere including emissions from energy generation and heat production at own plants, flaring (including well testing/well work-over), cold venting, diffuse emissions, and the storage and loading of crude oil.
- **Methane (CH_4) emissions intensity**: Total methane emissions from our up- and midstream activities divided by the marketed gas, both on a 100% operated basis.
- **Net carbon intensity**: GHG emissions associated with the production and use of energy produced by Equinor, including emissions related to carbon services and offsets, divided by the amount of energy produced by the company. See Equinor.com for a full description of approach and methodology.
- **Net Present Value (NPV)**: The value that is calculated by discounting the resulting net cash flow with the required rate of return.
- **Nitrous oxide (N_2O) emissions**: N_2O released to the atmosphere from power and heat generation and from flaring.
- **Scope 1 GHG emissions**: Direct GHG emissions from operations that are owned and/or controlled by the organisation (Source: Greenhouse gas protocol). Global warming potentials (GWPs) are used to convert non-CO_2 gases into CO_2 equivalents. In accordance with the Intergovernmental Panel on Climate Change (IPCC) Sixth Assessment Report (AR6), the GWP (100-year time horizon) of methane (CH_4) is 29.8 and nitrous oxide (N_2O) is 273, relative to CO_2.
- **Scope 2 GHG emissions**: Indirect GHG emissions from energy imported from third parties, heating, cooling, and steam consumed within the organisation. We use IEA/NVE/e-grid (location-based) and AIB (market-based) as sources of scope 2 emissions factor, expressed as kg CO_2/kWh. The location-based calculation method reflects the emissions intensity of grids, taking electricity trade adjustments into account. The market-based calculation method reflects emissions from electricity that companies have purposefully chosen (or their lack of choice). It derives emission factors from contracts between two parties for the sale and purchase of energy bundled with attributes about the energy generation, or for unbundled attribute claims. (Source: Greenhouse gas protocol). When no such contracts are in place, residual mix emission factors are used.
